# SmartWave

---

Capable of simulating and enabling forecasting of significant wave height

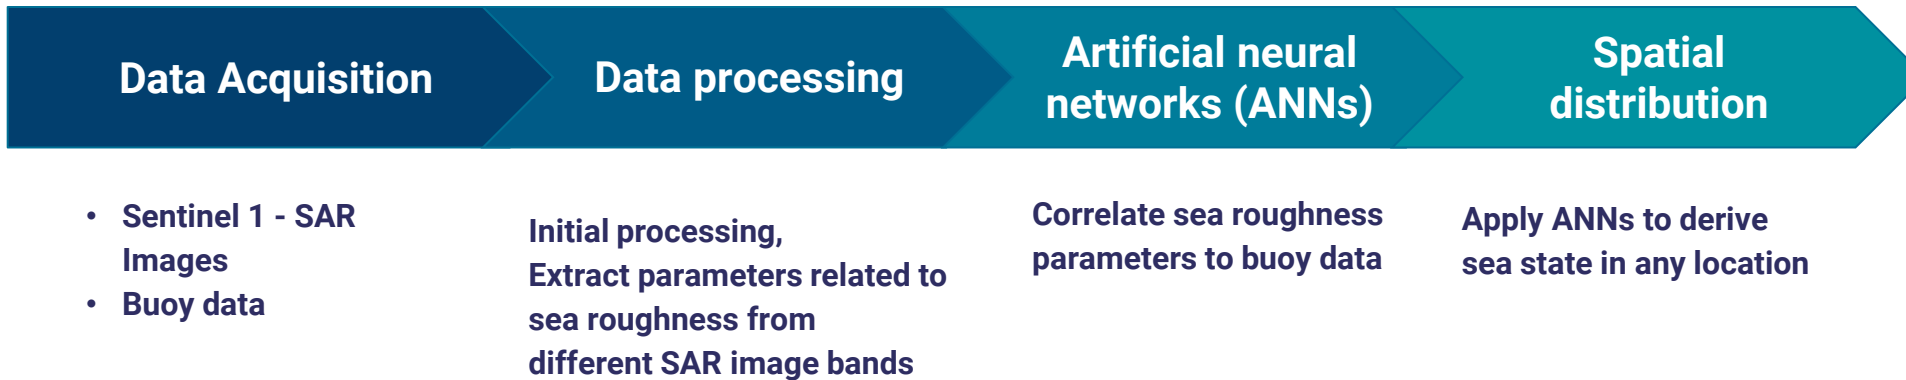

Motivation: Develop SmartWave to simulate parameters useful for marine renewables

# Satellite images

- Satellite images are capable of providing hindcast information in very high resolution
- How it works:
  - Radar transmits a pulse
  - Some of the energy in the radar pulse is reflected back
  - Every pixel of a complex SAR image contains amplitude and phase information.
- Can provide information about the sea roughness
- Using SAR images that means:
  - Unaffected by weather
  - Unaffected by cloud cover
  - Larger datasets

# How it works

# Example results – Burbo Bank

Comparison of Sea state conditions at 2/4/2019 06:32:16am

Buoy data: 0.89m (6:30am) – 1.07m (7:00am)

Numerical model at the buoy: 0.92m

ANN Ensemble: 0.95m

- Same trend of significant wave height for both hindcasts
- Higher resolution for machine learning-satellite image methodology
- Possible to identify patterns like sheltering in the inner wind turbines compared to the ones that are at the edge of the wind farm.

Buoy location →

(a) CMEMS-NWS-0.016deg

Sea state derived by (a) Copernicus freely available numerical model  
(b) Machine learning – Satellite image methodology processing SAR images

(b) ANN Ensemble - 0.002deg

# Uses of SmartWave

---

# NHP-WEC plans

- Development of SmartWave to simulate:
  - Wave length ( $\lambda$ ) – the distance between successive peaks of the wave
  - Wave height ( $H$ ) – the difference in height between peaks and troughs
  - Period ( $t$ ) – the time in seconds taken for successive peaks pass a given fixed point.

$$f = 1/t$$

frequency: number of peak-to-peaks per second  
EQUALS  
the reciprocal (meaning 1 DIVIDED by)  
the time in seconds taken for successive peaks (or troughs) to pass a given fixed point

$$v = \lambda/t$$

velocity  
EQUAL TO  
wavelength  
DIVIDED BY  
the time in seconds taken for successive peaks (or troughs) to pass a given fixed point

$$P \approx H^2 t$$

power of wave  
APPROX EQUAL TO  
height (squared)  
MULTIPLIED BY  
the time in seconds taken for successive peaks (or troughs) to pass a given fixed point

expressed as kilowatts per metre of wave front  
(kW m<sup>-1</sup>)

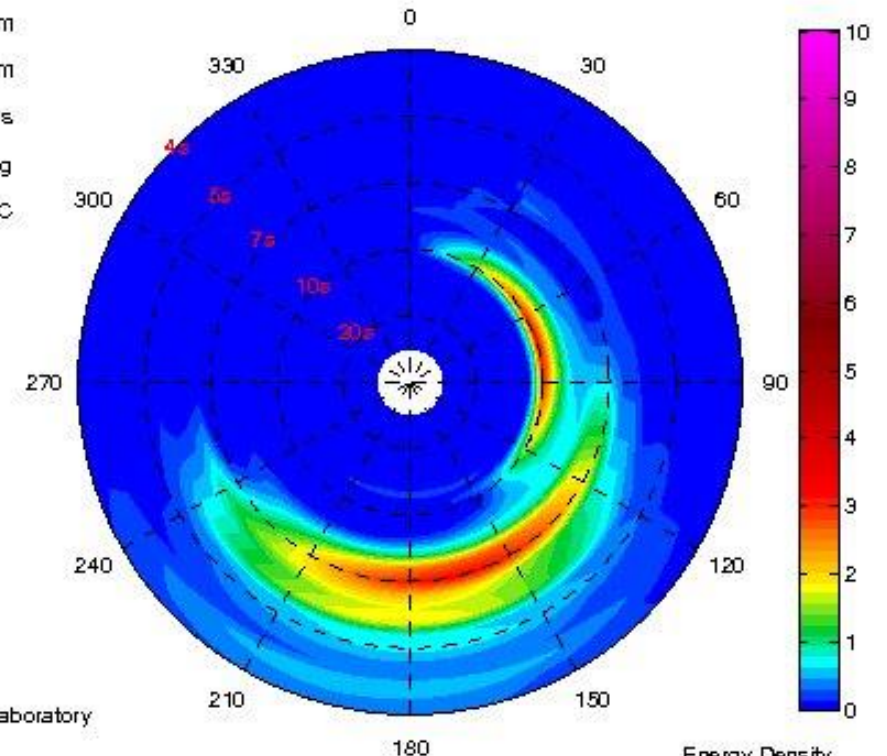

# Wave parameters

- Ideally to fully characterise a wave field we need the spectra
- Help calculate the energy produced from each motion

Directional Spectra for Port Kembla at 22-Nov-2012 03:00

Hs: 2.4 m  
Hmax: 4.1 m  
Tp1: 7.0 s  
Dir: 183 deg  
Temp: 18.2 degC
